

PRACTICAL-6

AIM:

Demonstrate the static and dynamic configuration of NAT using cisco packet tracer

THEORY:

- ❖ NAT stands for “Network Address Translation”.
- ❖ A Network Address Translation (NAT) is the process of mapping an internet protocol (IP) address to another by changing the header of IP packets while in transit via a router.
- ❖ This helps to improve security and decrease the number of IP addresses an organization needs.
- ❖ Usually a firewall, assigns a public address to a computer (or group of computers) inside a private network.
- ❖ The most common form of network translation involves a large private network using addresses in a private range
- ❖ The private addressing scheme works well for computers that only have to access resources inside the network, like workstations needing access to file servers and printers.
- ❖ Routers inside the private network can route traffic between private addresses with no trouble.

- ❖ However, to access resources outside the network, like the Internet, these computers have to have a public address in order for responses to their requests to return to them. This is where NAT comes into play.
- ❖ It is suitable only for small network.
- ❖ If a link fails it cannot reroute the traffic.
- ❖ There are three types of address translation.
 - Static NAT – translates one private IP address to a public one. The public IP address is always the same.
 - Dynamic NAT – private IP addresses are mapped to the pool of public IP addresses.
 - Port Address Translation (PAT)– one public IP address is used for all internal devices, but a different port is assigned to each private IP address. Also known as NAT Overload.

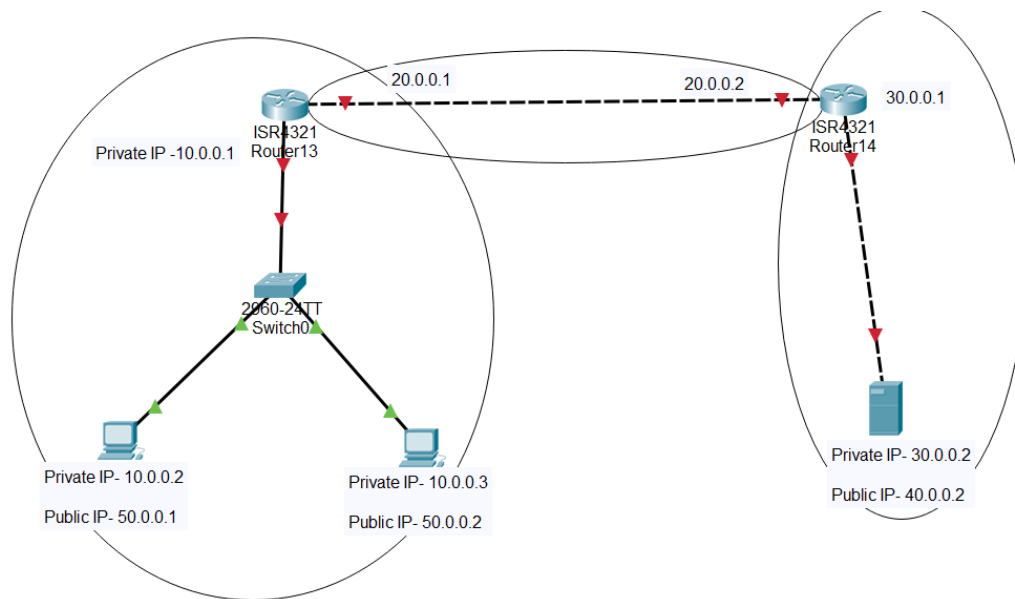

PRACTICAL IMPLEMENTATION:

STATIC NAT:

- ❖ Firstly, create a topology shown in the picture below by connecting the devices through appropriate connections.
- ❖ For the topology, we will use 2 routers, 2 PCs, 1 switch, and 1 server.

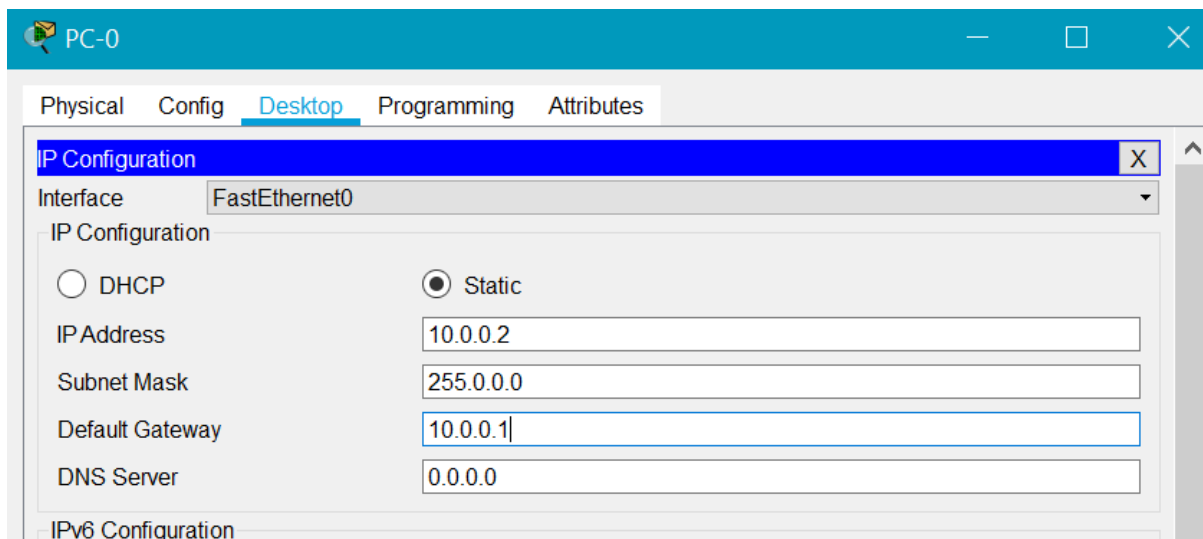

- ❖ Now, we will divide the topology into 3 networks.
- ❖ Also, we will assign private and public IP addresses to each end devices and gateways.
- ❖ Topology will now look like the below image.

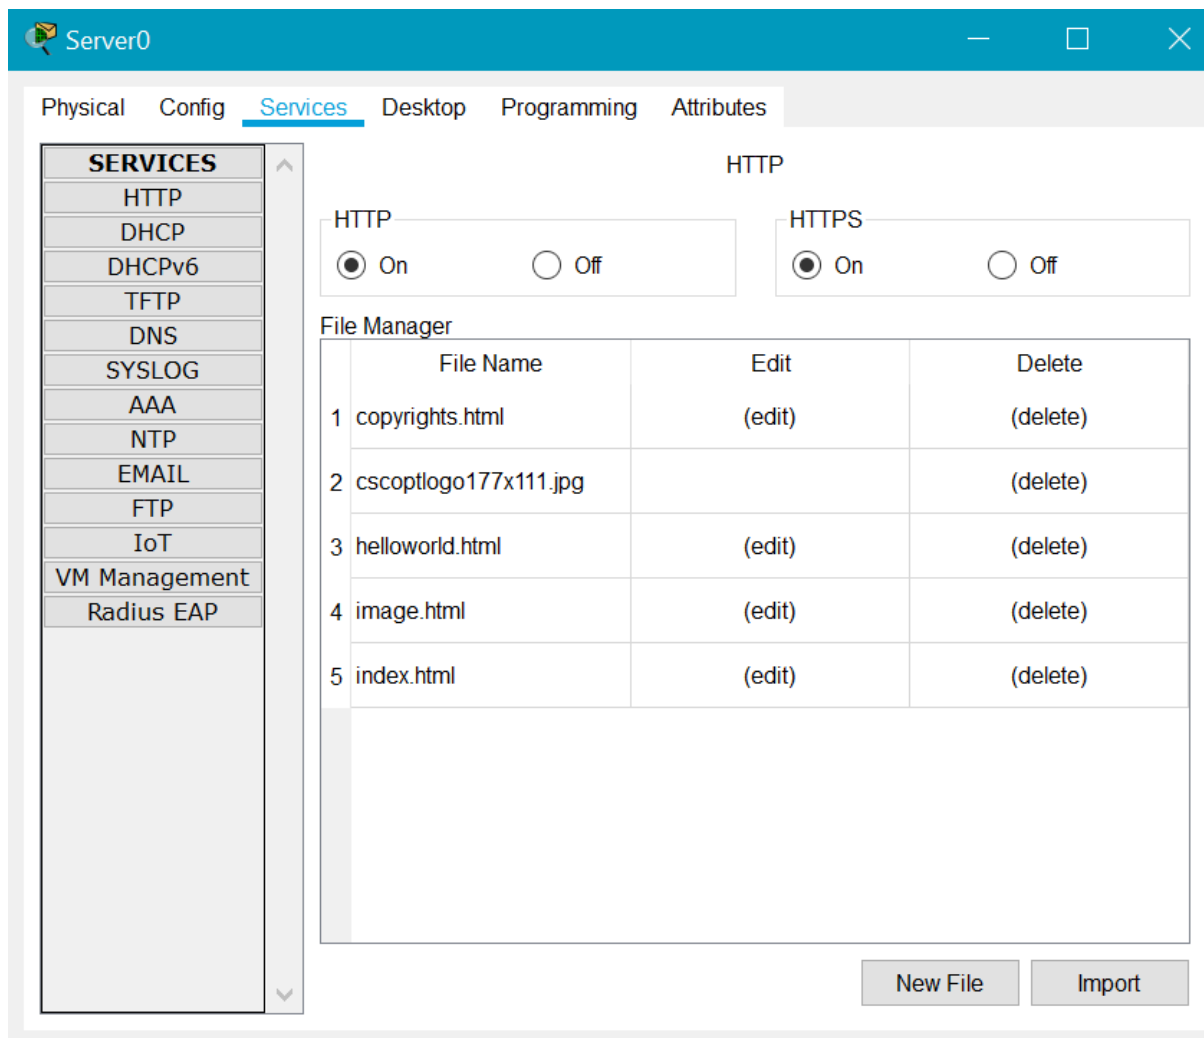

❖ Now, assign Private IP address to the end devices.

❖ Steps are: PC -> IP configuration -> Enter the IP address and Gateway.

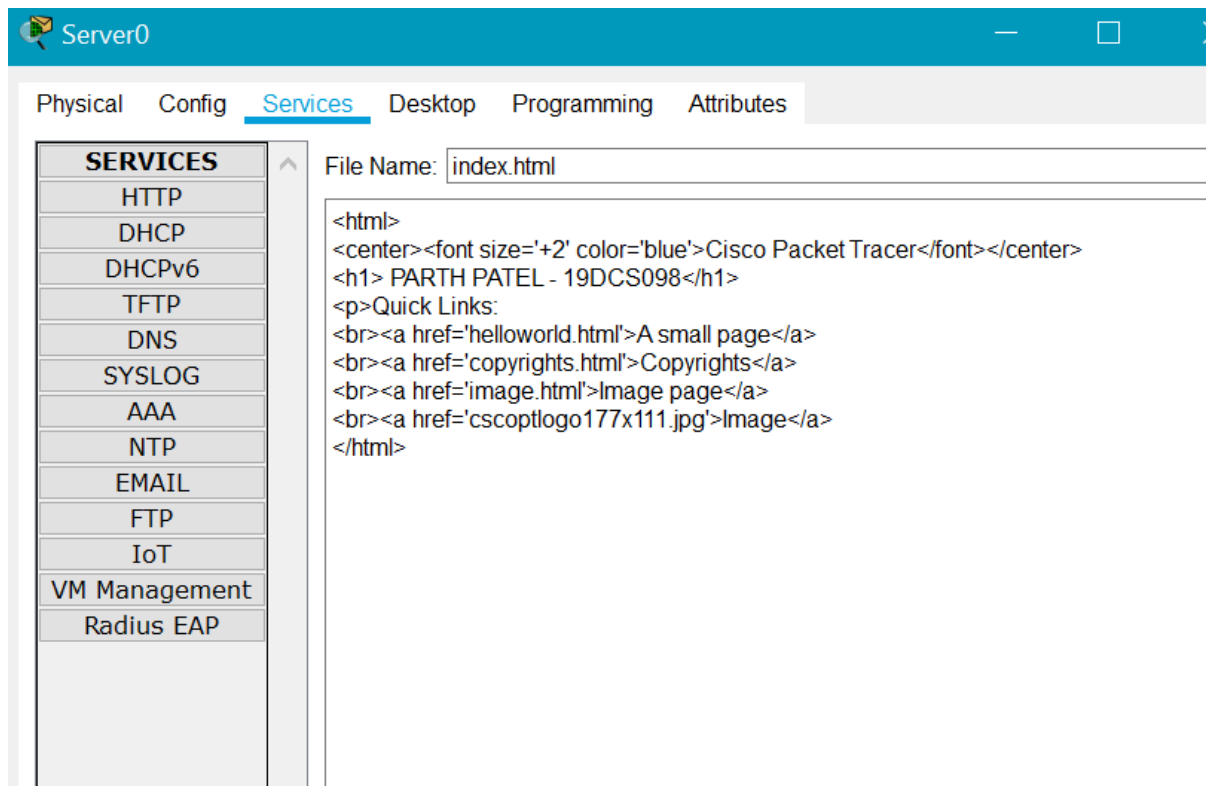

❖ Perform the same steps for all the PCs.

- ❖ In server services, we will select the HTTP option.

- ❖ Now, make some changes in index.html.

- ❖ Now, configure the router.
- ❖ This time, we will use config mode instead of CLI mode.

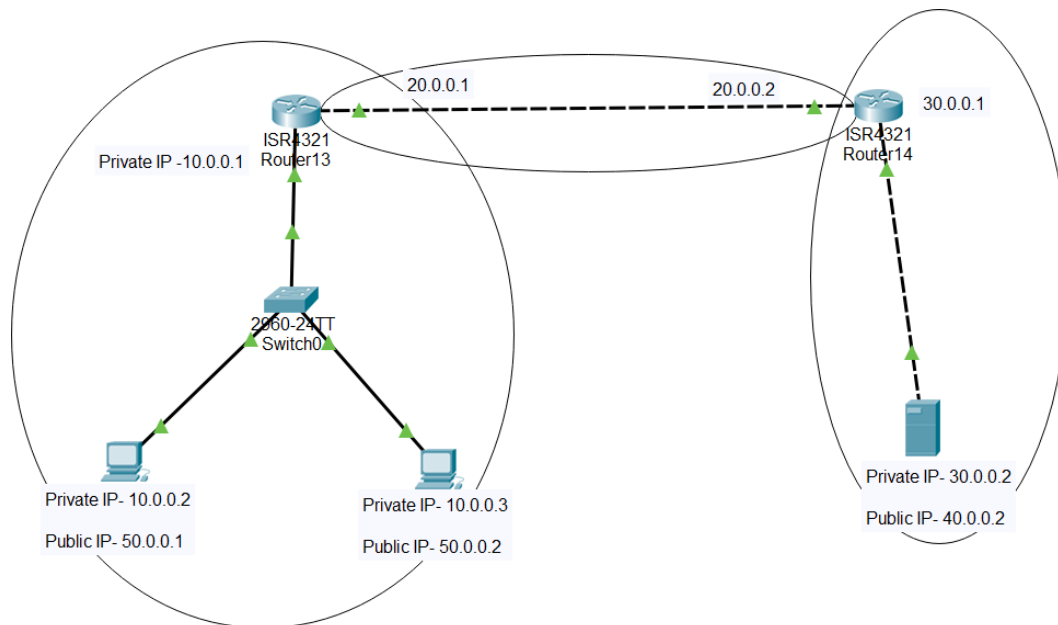

- ❖ For this method, Go to Config tab -> enter the IP address and check the On option.

The screenshot shows the 'Router13' configuration window with the 'Config' tab selected. The left sidebar contains a tree view with categories: GLOBAL, ROUTING, SWITCHING, and INTERFACE. Under the INTERFACE category, 'GigabitEthernet0/0/0' is selected. The main panel displays the configuration for 'GigabitEthernet0/0/0'. The 'Port Status' is set to 'On' (checked). The 'Bandwidth' is set to '1000 Mbps' (selected). The 'Duplex' is set to 'Half Duplex' (selected). The 'MAC Address' is '0009.7C61.3901'. The 'IP Configuration' section shows 'IP Address' as '10.0.0.1' and 'Subnet Mask' as '255.0.0.0'. The 'Tx Ring Limit' is set to '10'. At the bottom, the 'Equivalent IOS Commands' section shows the following commands:

```
Router(config-if)#  
%LINK-5-CHANGED: Interface GigabitEthernet0/0/0, changed state to up  
  
%LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/0/0, changed state to up
```

- ❖ Perform the same steps for all the connections.

- ❖ Upon successful connection establishment, the Topology will look like the below image.

- ❖ Now, we will do the mapping of private and public IP address in Router.
- ❖ The above step will enable the router to know which public IP is mapped to its corresponding private IP.

```
Router(config-if)#exit
Router(config)#ip nat inside source static 10.0.0.2 50.0.0.1
Router(config)#ip nat inside source static 10.0.0.3 50.0.0.2
```

- ❖ This will let the router know the mappings of public and private IP.

```
Router(config)#int gigabitEthernet 0/0/0
Router(config-if)#ip nat inside
Router(config-if)#exit
```

```
Router(config)#int gigabitEthernet 0/0/1
Router(config-if)#ip nat outside
Router(config-if)#exit
```

- ❖ Follow the same steps for other router.
- ❖ Now we will do static routing configuration.

```
Router>enable
Router#configure terminal
Enter configuration commands, one per line. End with
CNTL/Z.
Router(config)#ip route 40.0.0.0 255.0.0.0 20.0.0.2
Router(config)#
```

- ❖ Perform the similar steps in other router.

NETWORK TESTING:

PING TEST:

```
Packet Tracer PC Command Line 1.0
C:\>ping 40.0.0.1

Pinging 40.0.0.1 with 32 bytes of data:

Reply from 40.0.0.1: bytes=32 time=14ms TTL=126
Reply from 40.0.0.1: bytes=32 time=27ms TTL=126
Reply from 40.0.0.1: bytes=32 time=14ms TTL=126
Reply from 40.0.0.1: bytes=32 time=27ms TTL=126

Ping statistics for 40.0.0.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 14ms, Maximum = 27ms, Average = 20ms
```

We can ping the server using public IP address

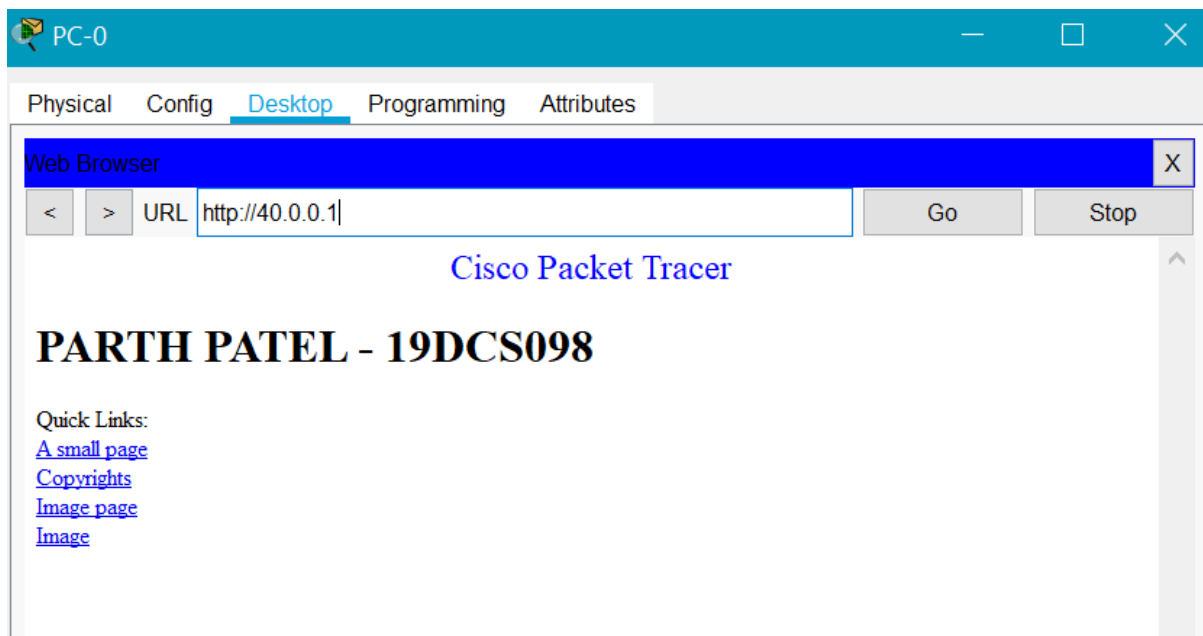

```
C:\>ping 30.0.0.2

Pinging 30.0.0.2 with 32 bytes of data:

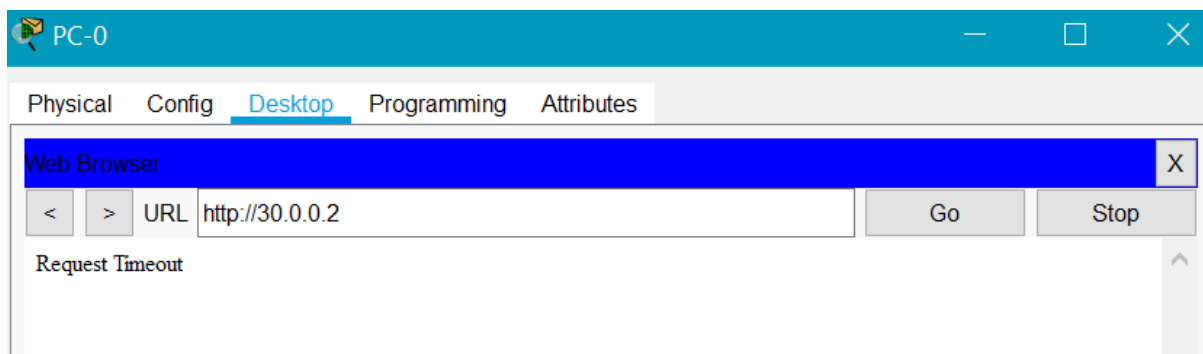

Reply from 10.0.0.1: Destination host unreachable.
Request timed out.
Reply from 10.0.0.1: Destination host unreachable.
Reply from 10.0.0.1: Destination host unreachable.

Ping statistics for 30.0.0.2:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

We cannot ping the server using private IP address.

TESTING USING BROWSER:

We can access index.html through public IP address

We cannot access index.html with private IP address.

DYNAMIC NAT:

- ❖ FOR DYNAMIC NAT, we will keep the same topology.
- ❖ So, first, we need to follow the same steps till the configuration of router.
- ❖ Now, after configuring the connection, the topology will be like the image below.

- ❖ Now, follow the below steps for Dynamic NAT configuration.

```
Router(config)#  
Router(config)#access-list 1 permit 192.168.1.0 0.0.0.255  
Router(config)#
```

```
Router(config)#int GigabitEthernet0/0/0  
Router(config-if)#ip nat inside  
Router(config-if)#exit
```

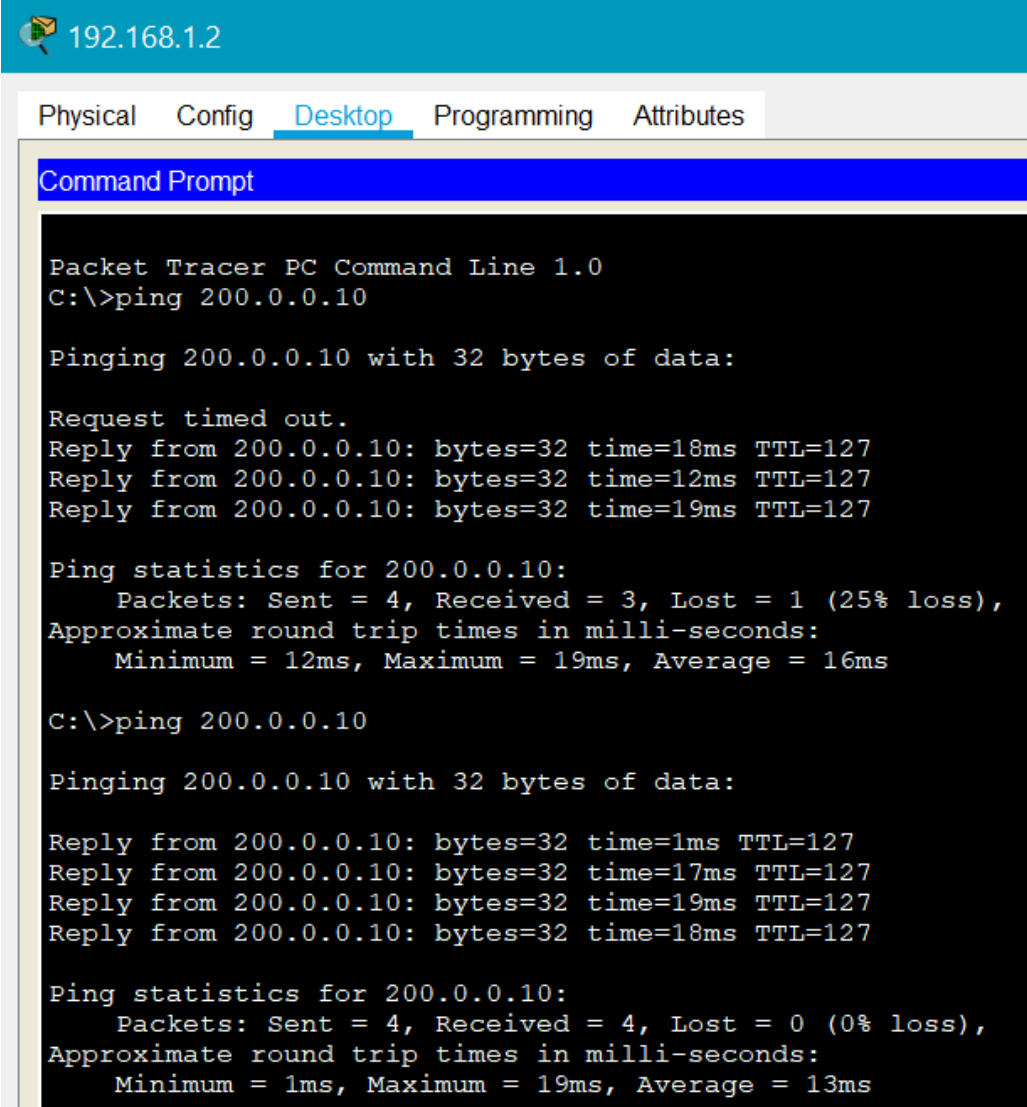

```
Router(config)#int GigabitEthernet0/0/1  
Router(config-if)#ip nat pool parth 155.21.21.10 155.21.21.15 netmask 255.255.0.0  
Router(config)#  
Router(config)#ip nat inside source list 1 pool parth  
Router(config)#exit  
Router#  
%SYS-5-CONFIG_I: Configured from console by console
```

- ❖ To verify the configuration, perform the below mentioned steps

```
Router#show ip nat translations  
Router#show access-list  
Standard IP access list 1  
    10 permit 192.168.1.0 0.0.0.255  
  
Router#|
```

NETWORK TESTING:

PING TEST:

The screenshot shows a Packet Tracer PC Command Line window for a device with IP 192.168.1.2. The 'Desktop' tab is selected. The command prompt shows a ping test to 200.0.0.10. The first test shows a 25% packet loss (1 out of 4 packets lost) with round trip times of 12ms, 18ms, 19ms, and 12ms. The second test shows 0% packet loss (4 out of 4 packets received) with round trip times of 1ms, 17ms, 19ms, and 18ms.

```
Packet Tracer PC Command Line 1.0
C:\>ping 200.0.0.10

Pinging 200.0.0.10 with 32 bytes of data:

Request timed out.
Reply from 200.0.0.10: bytes=32 time=18ms TTL=127
Reply from 200.0.0.10: bytes=32 time=12ms TTL=127
Reply from 200.0.0.10: bytes=32 time=19ms TTL=127

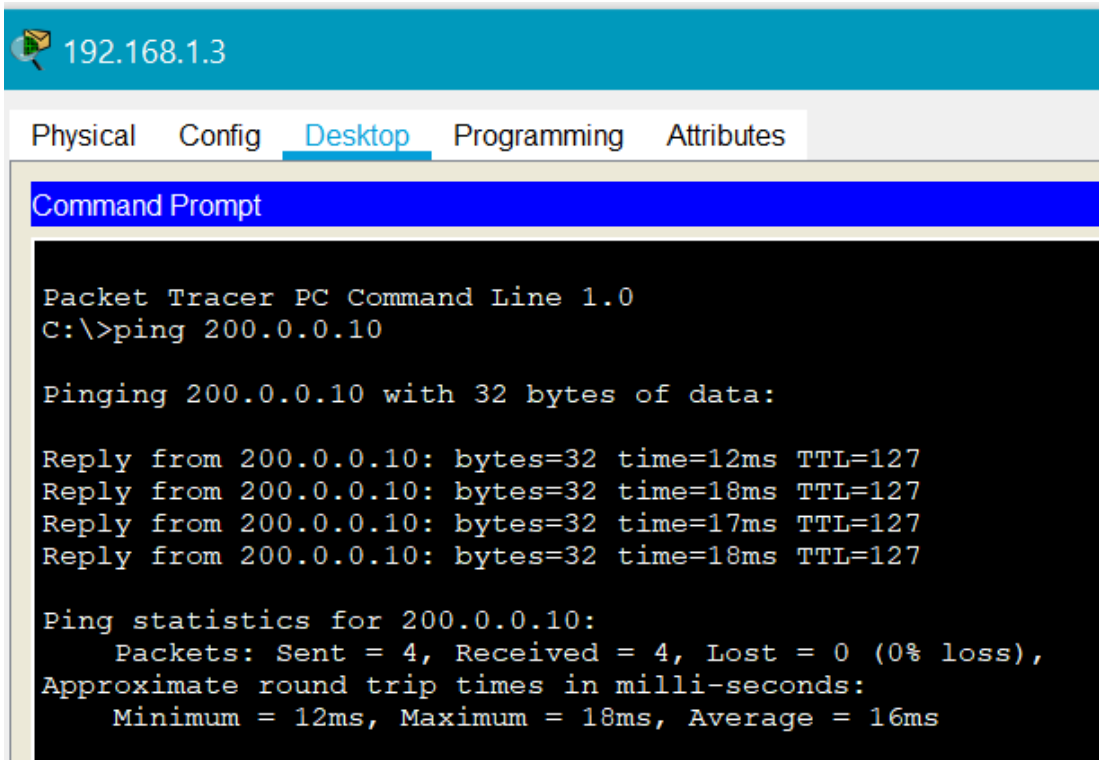

Ping statistics for 200.0.0.10:
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 12ms, Maximum = 19ms, Average = 16ms

C:\>ping 200.0.0.10

Pinging 200.0.0.10 with 32 bytes of data:

Reply from 200.0.0.10: bytes=32 time=1ms TTL=127
Reply from 200.0.0.10: bytes=32 time=17ms TTL=127
Reply from 200.0.0.10: bytes=32 time=19ms TTL=127
Reply from 200.0.0.10: bytes=32 time=18ms TTL=127

Ping statistics for 200.0.0.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 1ms, Maximum = 19ms, Average = 13ms
```

192.168.1.3

Physical Config Desktop Programming Attributes

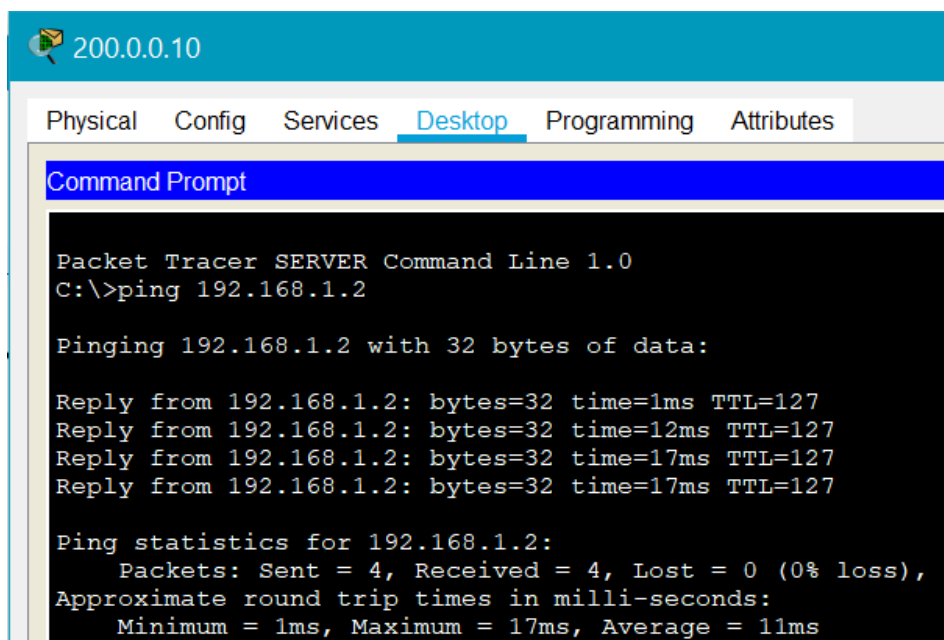

Command Prompt

```
Packet Tracer PC Command Line 1.0
C:\>ping 200.0.0.10

Pinging 200.0.0.10 with 32 bytes of data:

Reply from 200.0.0.10: bytes=32 time=12ms TTL=127
Reply from 200.0.0.10: bytes=32 time=18ms TTL=127
Reply from 200.0.0.10: bytes=32 time=17ms TTL=127
Reply from 200.0.0.10: bytes=32 time=18ms TTL=127

Ping statistics for 200.0.0.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 12ms, Maximum = 18ms, Average = 16ms
```

200.0.0.10

Physical Config Services Desktop Programming Attributes

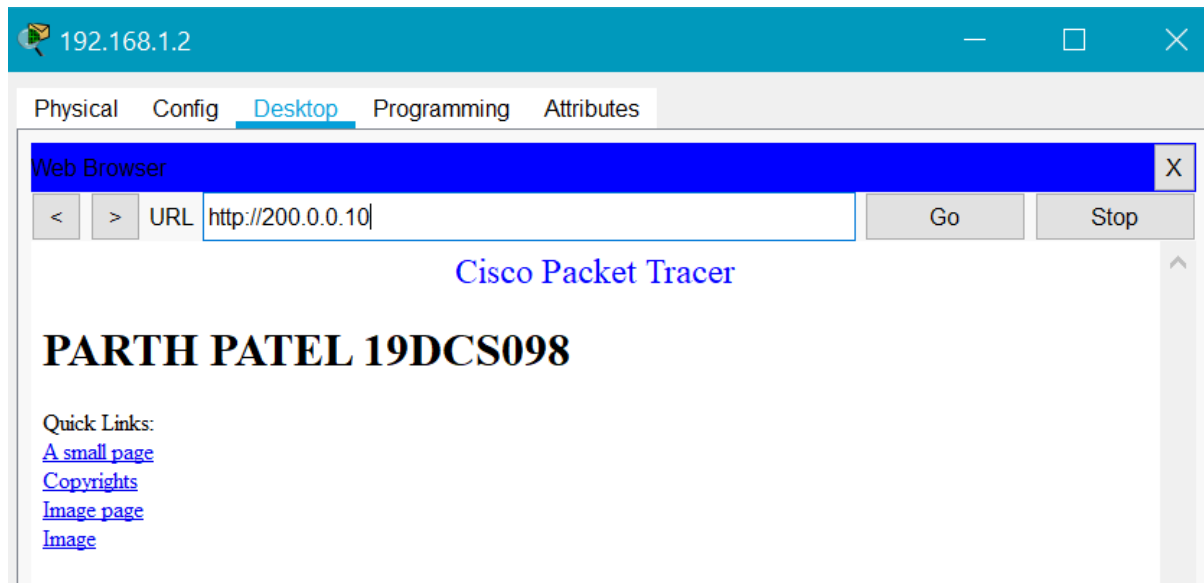

Command Prompt

```
Packet Tracer SERVER Command Line 1.0
C:\>ping 192.168.1.2

Pinging 192.168.1.2 with 32 bytes of data:

Reply from 192.168.1.2: bytes=32 time=1ms TTL=127
Reply from 192.168.1.2: bytes=32 time=12ms TTL=127
Reply from 192.168.1.2: bytes=32 time=17ms TTL=127
Reply from 192.168.1.2: bytes=32 time=17ms TTL=127

Ping statistics for 192.168.1.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 1ms, Maximum = 17ms, Average = 11ms
```

TESTING THROUGH WEB BROWSER:**CONCLUSION:**

- ❖ By performing the above practical, we learned the concept of NAT.
- ❖ We also learned the types of NAT.
- ❖ We also learned how to configure the network using STATIC NAT and DYNAMIC NAT.
