

## **PRACTICAL-8**

### **AIM:**

To Install and Run Hive. Use Hive to create, alter, and drop databases, tables, views, functions, and indexes. To create HDFS tables and load them in Hive and implement joining of tables in Hive

### **THEORY:**

#### **Hive:**

- Hive is a data warehouse infrastructure tool to process structured data in Hadoop. It resides on top of Hadoop to summarize Big Data, and makes querying and analyzing easy.
- This is a brief tutorial that provides an introduction on how to use Apache Hive HiveQL with Hadoop Distributed File System. This tutorial can be your first step towards becoming a successful Hadoop Developer with Hive.
- Apache Hive is a data warehouse software project built on top of Apache Hadoop for providing data query and analysis.
- Hive gives an SQL-like interface to query data stored in various databases and file systems that integrate with Hadoop. Traditional SQL queries must be implemented in the MapReduce Java API to execute SQL applications and queries over distributed data. Hive provides the necessary SQL abstraction to integrate SQL-like queries (HiveQL) into the underlying Java without the need to implement queries in the low-level Java API. Since most data warehousing applications work with SQL-based querying languages, Hive aids portability of SQL-based applications to Hadoop.
- While initially developed by Facebook, Apache Hive is used and developed by other companies such as Netflix and the Financial Industry Regulatory Authority (FINRA).
- Amazon maintains a software fork of Apache Hive included in Amazon Elastic MapReduce on Amazon Web Services.

**CODE:**

CREATE DATABASE [IF NOT EXISTS] userdb;

```
hive> CREATE DATABASE IF NOT EXISTS userdb;  
OK  
Time taken: 1.686 seconds
```

CREATE SCHEMA userdb;

```
hive> CREATE SCHEMA userdb2;  
OK  
Time taken: 0.44 seconds  
hive> SHOW DATABASES;
```

SHOW DATABASES;

```
hive> SHOW DATABASES;  
OK  
default  
userdb  
userdb2  
Time taken: 1.559 seconds, Fetched: 3 row(s)  
hive> █
```

CREATE TABLE IF NOT EXISTS employee ( eid int, name String, salary String, destination String) COMMENT 'Employee details' ROW FORMAT DELIMITED FIELDS TERMINATED BY '\t' LINES TERMINATED BY '\n'

STORED AS TEXTFILE;

```
hive> CREATE TABLE IF NOT EXISTS employee (eid int, name String, salary String,  
destination String)  
> COMMENT 'Employee details'  
> ROW FORMAT DELIMITED  
> FIELDS TERMINATED BY '\t'  
> LINES TERMINATED BY '\n'  
> STORED AS TEXTFILE;  
OK  
Time taken: 0.191 seconds  
hive>
```

INSERT INTO employee VALUES (1, 'Robin', '20000', 'London');

SELECT \* FROM employee;

8	1	Robin	20000	London
9	4	Leo	30000	Silicon Valley
10	2	Cooper	25000	New York
11	3	Lucy	10000	California

ALTER TABLE name RENAME TO new\_name;

```
hive> ALTER TABLE employee RENAME TO new_employee;
OK
Time taken: 0.536 seconds
```

ALTER TABLE name ADD COLUMNS (col\_spec[, col\_spec ...]);

```
hive> ALTER TABLE new_employee ADD COLUMNS (designation String);
OK
Time taken: 0.403 seconds
hive>
```

ALTER TABLE name CHANGE column\_name new\_name new\_type;

```
hive> ALTER TABLE new_employee CHANGE designation promotion String;
OK
Time taken: 0.29 seconds
hive>
```

## CONCLUSION:

In this practical, we learnt about hive and performed different operations using it.
